

# Demand Analysis

# Learning objectives

---

1. 3 Conditions of demand
2. Types of Demand
3. Demand schedule
4. Demand curve
5. Demand function
6. Law of demand
7. Exceptions to the law of demand
8. Individual and market demand

# Importance of Demand Analysis

# Three Conditions of Demand

1. Desire to buy something.
2. Ability to pay for that goods or services.
3. Desire to spend money for buying that good or service.

# Types of Demand

Price Demand

Income Demand

Cross Demand

# Price Demand

---

- Two terms to describe the demand
  1. Price
  2. Quantity demanded
- Price of a Product affect the demand:

|                        |                                   |
|------------------------|-----------------------------------|
| Price (P) $\uparrow$   | Quantity Demand (Qd) $\downarrow$ |
| Price (P) $\downarrow$ | Quantity Demand(Qd) $\uparrow$    |

# Income Demand:

- Two terms to describe the demand

1. Income
2. Demand

- For Normal Goods: Consumer's income will affect the demand positively:

Income(Y)  $\uparrow$       Demand (D)  $\uparrow$

Income(Y)  $\downarrow$       Demand (D)  $\downarrow$

- For Inferior Goods: Consumer's income will affect the demand inversely:

Income(Y)  $\uparrow$       Demand (D)  $\downarrow$

Income(Y)  $\downarrow$       Demand (D)  $\uparrow$

## Normal Goods

- Goods that experience an increase in demand as the income of an individual increases are called normal goods.

## Inferior Goods

- Goods that experience a decrease in demand as the income of an individual increases are called inferior goods.

# Cross Demand:

---

There are 2 types of cross demand for inter-related products:

1. Cross demand for substitutes.
2. Cross demand for complements.

# Cross demand for substitutes:

Here,

P = Price

Qd = Quantity demand

| Tea(p) | Coffee(Qd) |
|--------|------------|
| P(↑)   | Qd(↑)      |
| P (↓)  | Qd(↓)      |

# Cross demand for Complements:

Here,

P = Price

Qd = Quantity demand

| Ball (p) | Bat (Qd) |
|----------|----------|
| P (↑)    | Qd(↓)    |
| P(↓)     | Qd(↑)    |

# Demand schedule and curve:

- Demand schedule: Tabular representation of negative relationship between price and quantity demanded.

| Price( Tk ) | Quantity Demanded ( kg ) |
|-------------|--------------------------|
| 50          | 1                        |
| 40          | 2                        |
| 30          | 3                        |
| 20          | 4                        |
| 10          | 5                        |

# Demand schedule and curve (Cont.):

- Demand Curve: Graphical representation of negative relationship between price and quantity demanded.

# DEMAND FUNCTION

---

- What is demand function? Algebraic expression of negative relationship between price and quantity demanded.
- Demand Function Formula :

$$Q_d = f(P)$$

Here,

P= Price

$Q_d$ = Quantity Demanded

f= Function

# Law of Demand

---

Other things remaining constant, If-

|          |                    |
|----------|--------------------|
| price(↑) | Quantity Demand(↓) |
| price(↓) | Quantity Demand(↑) |

# EXCEPTIONS TO THE LAW OF DEMAND

---

1. In case of deliberately shortage
2. In case of luxury item
3. Sheer ignorance
4. If necessary items price goes higher
5. In case of out of fashion goods

# Individual & Market Demand

- Definition
- Demand Schedule:

| Price of<br>Product 'A' | Individual Demand |         |         | Market Demand                 |
|-------------------------|-------------------|---------|---------|-------------------------------|
| (TK.)                   | Buyer<br>X        | Buyer Y | Buyer Z | All Buyers Demand<br>( X+Y+Z) |
| 250                     | 1                 | 2       | 3       | 6                             |
| 300                     | 0                 | 1       | 2       | 3                             |
| 200                     | 2                 | 3       | 4       | 9                             |

# Individual & Market Demand(Cont.)

- Curve:

Price(TK.)

Buyer X

This curve is representing the individual quantity of demand of **buyer X**.

# Individual & Market Demand(Cont.)

- **Curve:**

This curve is representing the individual quantity of demand of **buyer Y**.

# Individual & Market Demand(Cont.)

Curve:

This curve is representing the individual quantity of demand of **buyer Z**.

# Individual & Market Demand(Cont.):

## Curve & Schedule:

| Price of product (TK.) | Market Demand All Buyers Demand (X+Y+Z) |
|------------------------|-----------------------------------------|
| 250                    | 6                                       |
| 300                    | 3                                       |
| 200                    | 9                                       |

# DETERMINANTS OF DEMAND

---

A Consumer's demand for a commodity or service depends on several factors, the most important of which are the following:

- Price of the commodity or service,
- Consumers' income,
- Prices of related goods or services,
- Consumer tastes and preferences,
- Age of the Population and its distribution.
- Consumers' expectations regarding future price
- Weather/seasonal matter.
